**PROJECT NAME :** Memo Apps.

**Why We Choose This Project:** We make memo apps for reduce restaurant service problem. As a computer science student, we always want to do something new and always want to do something special for client.

In our project we would fix to restaurant boring issue. Because we always see that when we go to restaurant a waiter come to us and give us menu for food and price. If we order it, they take time go to kitchen and come with our ordered food, then if we feel some problem, we call waiter for fix this.

In our apps we going to make this process easy. At first a customer come and go to seat and take our windows tab and scroll for choose food the food list with price, offer and making time (How much need time to process it). When a customer clicks a food picture two time, he sees a new window for payment system (bKash QR code scanning system) and how much person's food (It also have multiple type food choose system). After finishing your all of process this apps sent a message to restaurant center for this ordered food. And after your given time a waiter come with your food and give it to you. If customer feel any problem, he able to send message restaurant center by this apps.

By this process we see that customers always feel easy in restaurant. After all of this process, customers don't need to pay by cash, they do it by automatic process. And customers don't need to faces waiter many times.

### Requirement List:

1. Operating System (Windows 7, windows 10).
2. Software (Visual Studio).
3. Database.
4. Algorithm.
5. Group Work(github).
6. Ram: 2GB or more than 2GB.

6. Ram: 2GB or more than 2GB.

5. Group Work(github).

### Modules:

1. Customer Services.
2. Automatic Food Order.
3. Pay bill automatically,
4. Ontime Food view..
5. Ontime food price view.
6. Fixing waiter issue.
7. Message to center for any problem.
8. Few person manage all the restaurant.
9. No need to call waiter.
